R&D Engineer

Location: Hong Kong

Company: Locolla Limited

Role Overview

LocoBike is seeking a **R&D Engineer** with strong full-stack capabilities and a solid understanding of **mobile application systems (iOS & Android)** to support our smart-mobility platform and applied research initiatives.

This role is for engineers who **use AI coding agents as a force multiplier, not a substitute for thinking**. You will be expected to design systems, make architectural decisions, and take full ownership of code quality while leveraging AI tools to deliver high-quality, maintainable, and well-reasoned solutions.

The position combines **mobile systems, backend services, and research-oriented programming**, working closely with product, operations, and research stakeholders.

Key Responsibilities

- Design and develop end-to-end systems across mobile applications (iOS & Android), backend services, APIs, and data layers
- Take ownership of system architecture, including component boundaries, data flow, and client-server responsibilities
- Collaborate with cross-functional teams to translate real-world operational and research requirements into scalable technical solutions

- Build and maintain backend services and integrations supporting LocoBike's core mobility and operations platforms
 - Work closely with mobile apps, understanding performance, latency, reliability, and real-world usage constraints
 - Use Python to support R&D activities, including:
 - Data processing and analysis
 - Algorithm prototyping and experimentation
 - Supporting research validation and technical documentation
 - Leverage AI coding agents to accelerate development while:
 - Clearly defining problems and constraints
 - Critically reviewing and validating generated code
 - Ensuring correctness, performance, and maintainability
 - Review AI-assisted outputs with a strong **verification mindset**, considering edge cases, failure modes, and long-term implications
 - Continuously improve system design, code quality, and development workflows
-

Requirements

Education & Experience

- Bachelor's degree or above in Computer Science, Engineering, Data Science, or a related discipline; Master's degree or PhD preferred.

Technical & Mindset Requirements

- Strong understanding of full-stack system architecture, including mobile frontend, backend services, and data layers
- Hands-on experience working with iOS and/or Android applications (native or cross-platform frameworks such as Flutter or React Native are acceptable)
- Backend development experience (e.g. Node.js, PHP, Python, or equivalent)

- Experience designing and consuming RESTful APIs and working with databases
 - Familiarity with AI coding agents and a demonstrated ability to:
 - Frame problems clearly before generating code
 - Evaluate, refine, and take ownership of AI-assisted outputs
 - Use AI to improve quality, not just speed
 - Strong architectural thinking, with the ability to reason about trade-offs, constraints, and system boundaries
 - High sense of ownership, accountability, and responsibility for production-quality systems
-

How to apply
